Guidelines for TeleICU Operations

Purpose

The following teleICU guidelines were developed to assist practitioners in providing assessment, medical intervention, continuous monitoring and/or consultation to the critical care population using telecommunication technologies. The guidelines focus on a network of audio-visual communication and computer systems for the delivery of critical care services. These interactive encounters link patients and Intensive Care Units (ICU) with remote and on site healthcare practitioners to enhance clinical practice and quality outcomes for the critically ill patient. The guidelines apply specifically to teleICU services and do not prescribe or recommend overall clinical protocols for ICU patient care. Rather, the focus is on the unique aspects of delivering collaborative care through the teleICU model.
